

Empowering others with worldwide qPCR and NGS solutions

As this week brings a lifting of covid restrictions across England with the onset of “freedom day” yesterday, it’s still crucial that we remain focused on fighting COVID-19 on a global scale. But as an ever-increasing percentage of the world population begins to have access to a COVID-19 vaccine, we can at least hope for a return to some sort of “normal” in the not-too-distant future.

What the last 18 months has really done is highlight the critical role of molecular biology in healthcare. Terms that were once mostly referenced exclusively within our industry such as PCR are now being used by the media and governments daily. Since the SARS-CoV-2 genomic sequence was first published in January last year we have seen a huge wave of data emerge and technological developments in our field that have enabled rapid progress in the form of both testing kits and vaccines.

Here at YouSeq we are extremely proud of the part we continue to play with helping the world to manage the pandemic; developing and providing testing kits to customers across the world. We are committed to enabling the fast detection of COVID-19 and its variants as they emerge. We also have a range of qPCR and NGS products to assist in essential continued virus research and would be happy to chat through with you further to understand how we can best help with your particular organisation’s needs – just give us a call on +44 (0) 333 577 6695.

YouSeq have already shipped over 20 million Covid-19 test kits worldwide
